January 2020 Tennessee State Climate Summary

Tennessee Climate Office * East Tennessee State University
Prepared by William Tollefson and Dr. Andrew Joyner
With contributions by Climate Data Representatives at University of Tennessee-Martin, Vanderbilt
University, University of Tennessee-Institute of Agriculture, University of Tennessee-Knoxville, and
University of Memphis

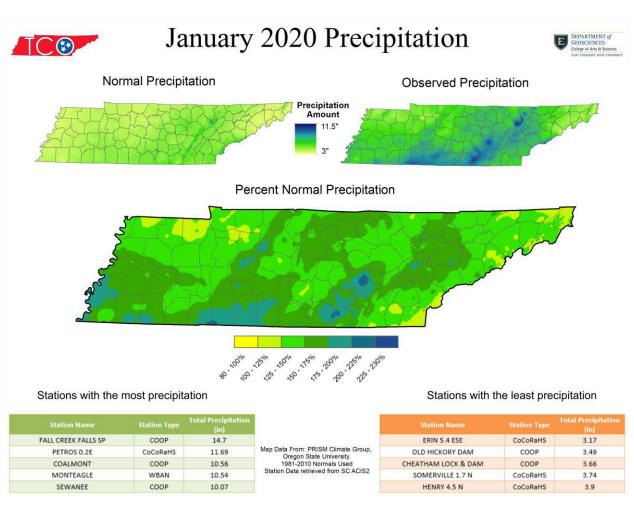

Monthly Temperature Summary:

Mean temperatures for January ran well above normal across the state, with most areas observing temperatures 4-6°F warmer than normal for the month. The first half of the month was the warmest period, with many areas recording temperatures 6-10°F above average. January 10th brought recordhigh low temperatures across the state, with low temperatures only dropping to 60°F in Memphis, 59°F in Jackson & Nashville, and 58°F in Clarksville, all of which were about twenty degrees above the normal high temperature for the date! Then on the 11th, record high temperatures were recorded in the eastern two-thirds of the state, with high temperatures reaching 77°F in Knoxville, 76°F in the Tri-Cities, 73°F in Oak Ridge, and 71°F in Nashville. A short cool spell brought temperatures below normal for a few days around the 19th-23rd, but temperatures for the end of the month returned to above normal conditions.

Monthly Precipitation Summary:

Almost all areas of the state recorded above normal precipitation for the month, with a majority of the state recording 125-175% of normal January precipitation totals. Most of that precipitation occurred as rainfall in the first half of the month, with widespread rainfall totals of more than four inches, or double the normal amount for the first two weeks of January. In the second half of the month, precipitation patterns were more varied, with most areas recording below normal precipitation; however, some smaller portions of the state did record above normal precipitation during the third or fourth weeks of the month. With the much above normal temperatures observed, almost all precipitation for the month came in the form of rainfall. Most locations in the state recorded no measurable snow accumulations, but light snow showers or flurries occurred at almost all locations across the state on the 20th or 21st on the tail end of a strong cold front that swept the state.

Station Data and Top Tenn. (warmest/wettest, coldest/driest stations of the month):

Station data for airports across the state using WBAN weather stations:

	Temperatures (°F)									Precipitation (inches)

An additional 86 stations reported a trace of snowfall during the month.

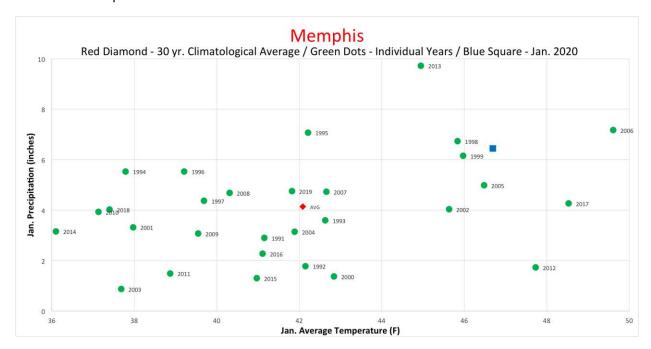

Drought Monitor:

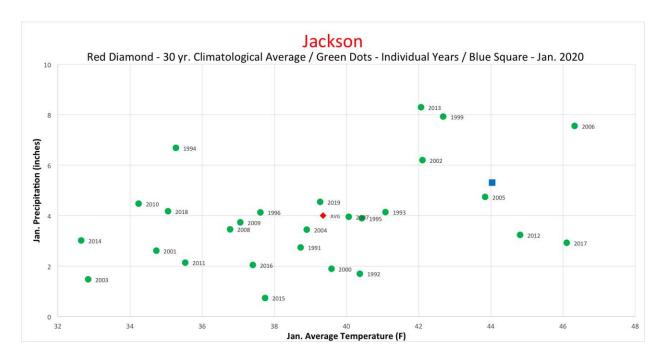

Due to the abundant rainfall at the beginning of the month, and in previous months, Tennessee remained clear of any drought conditions during January.

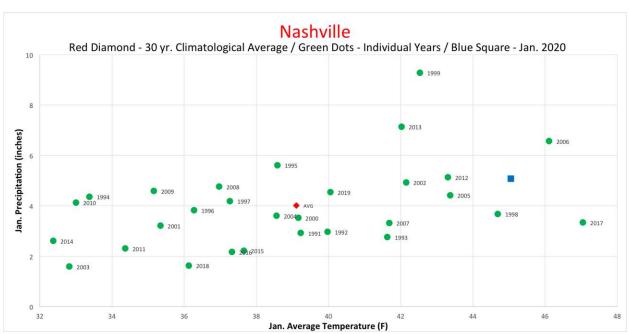

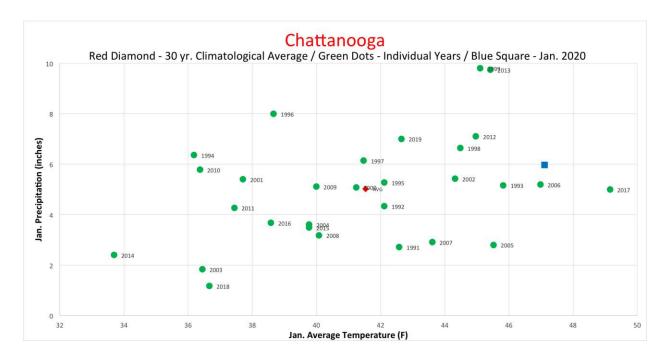

The Month in Comparison:

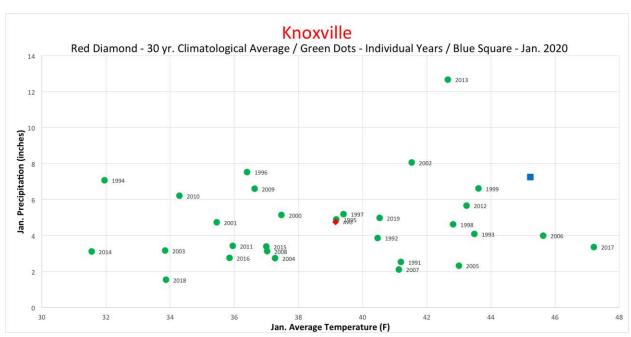

As noted in the monthly temperature and precipitation summaries, January 2020 was warmer and wetter than normal. Comparing this month to the previous 30 years of data for January we can see that Chattanooga had its second warmest January in this time period (only 2017 was warmer), Nashville, Knoxville, and the Tri-Cities airports had their third warmest Januaries for this period (with only 2017 and 2006 being warmer), and Memphis and Jackson had their fourth warmest January for this period. While precipitation was above normal, several other years had even wetter Januaries; only Memphis had one of its top 5 wettest Januaries.

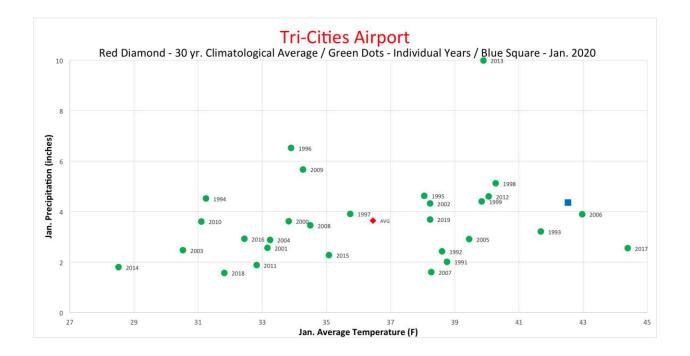

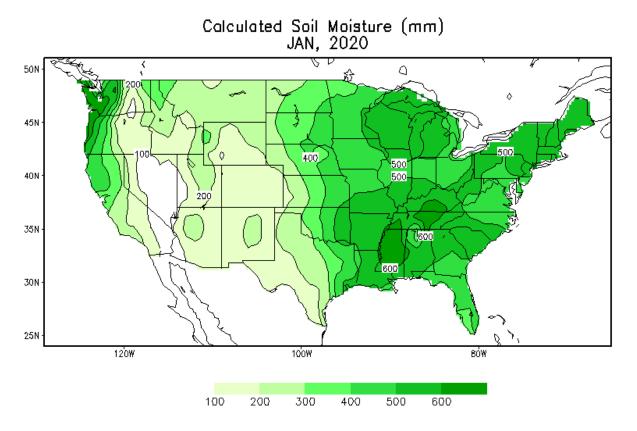

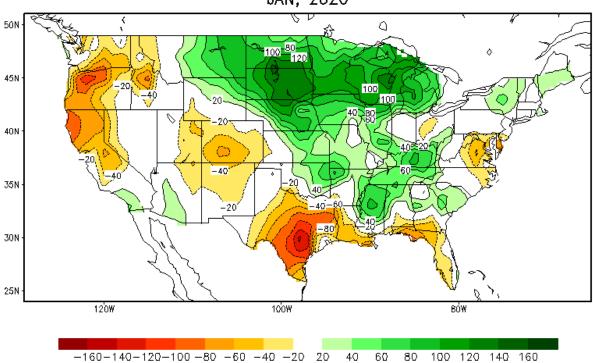

Soil Moisture:

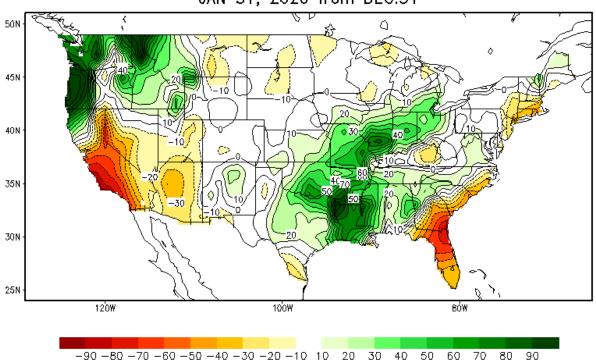

Soil moisture levels across Tennessee were above normal for January, with soil moistures in the 500 to 600mm range. Most of the state recorded an increase in soil moisture levels over the month, but some areas in Northeast Tennessee saw minor drops in soil moisture levels (about a 10mm decrease from the end of December to the end of January).

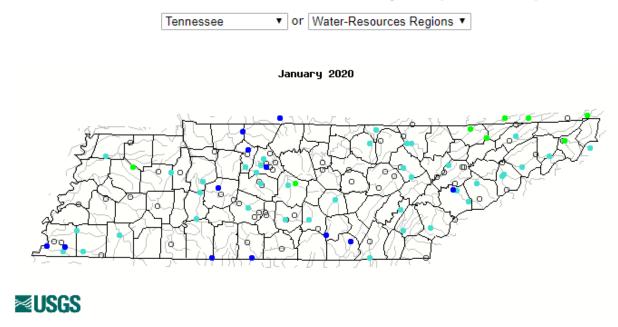

Calculated Soil Moisture Anomaly Change JAN 31, 2020 from DEC.31

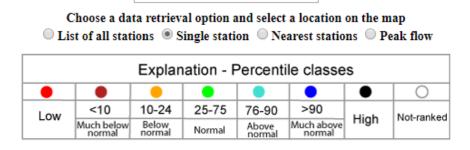

Streamflow:

Streamflow levels across the state were generally above, to much above normal for this time of year; with a few stream gauges in northeast Tennessee and one station each in Middle and West Tennessee being in the normal range.

Map of monthly streamflow compared to historical streamflow for the month of the year (Tennessee)

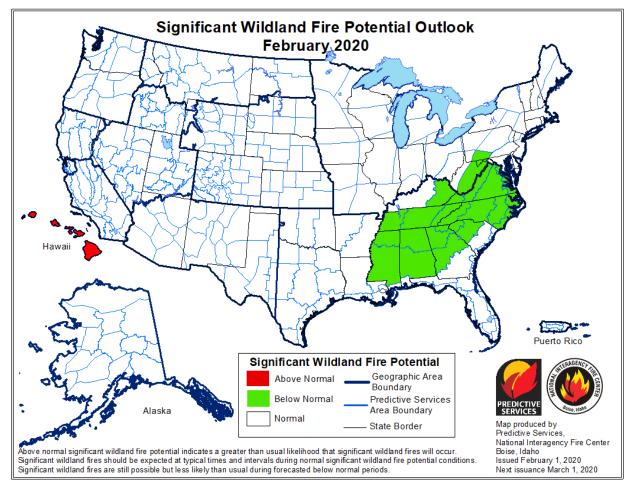

Search USGS streamgage

Miscellaneous:

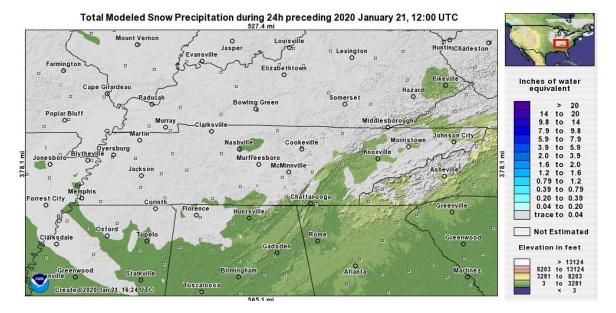

Crop Conditions from USDA: Crop progress and condition reports have ended for the season, and the USDA will resume issuing the reports for the state in April 2020.

Fire Danger:

The significant wildland fire outlook for February from the Interagency Fire Center shows all of Tennessee will have a below normal risk for wildfires next month.

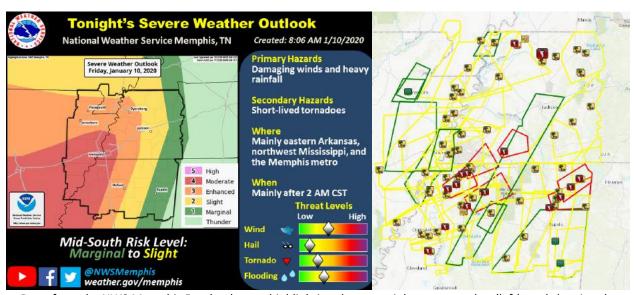

Snow: Outside of the highest mountain elevations only minor snowfall occurred this month. The Mt. LeConte COOP weather station (the highest elevation weather station in the state, located at 6,493 ft in the Great Smoky Mountains National Park) recorded 20.5" of snow over the month. The next highest monthly snow total at Newfound Gap (also in GSMNP, but about 1,500 ft lower in elevation) was only 4.5". Outside of the mountains, snow totals for the month were less than one inch. The biggest coverage of snowfall occurred on the 20th-21st with almost statewide mixed precipitation or light snowfall, resulting in many locations with a trace to 0.3 inches of snow accumulation.

Story of the Month:

The major story of the month was the much above normal warmth, particularly the first half of the month when severe storms, intensified by the warmth, occurred on the 10th and 11th. Severe weather was well forecasted along a strong cold front that swept the state on the 10th and 11th. The storm system first brought southerly winds and a surge of warm, moist air to the state, followed by a strong squall line with isolated tornadoes, and several reports of severe wind across the state (more detailed storm reports are given in the Storm Reports section).

Posts from the NWS Memphis Facebook page highlighting the potential severe weather (left), and showing the warnings issued paired with storm reports (right).

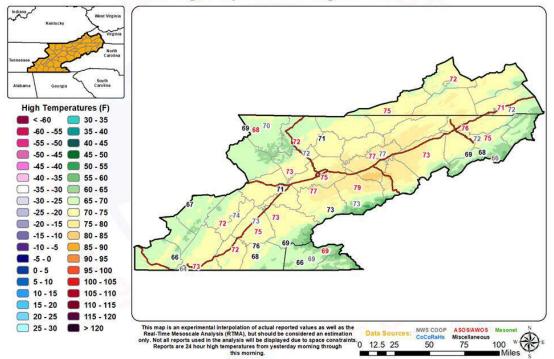

The eastern portion of the state had another day in the warm sector of the storm on the 11th, and with southerly winds leading to downslope warming in the Tennessee Valley temperatures surged into the mid to upper 70's across the region. The 11th also brought high winds and high temperatures, with high winds produced by both a mountain wave event and severe storms, wind gusts of 30-60mph were recorded throughout East Tennessee.

National Weather Service Morristown Tennessee

24 Hour High Temperatures Ending 7AM 01-12-2020

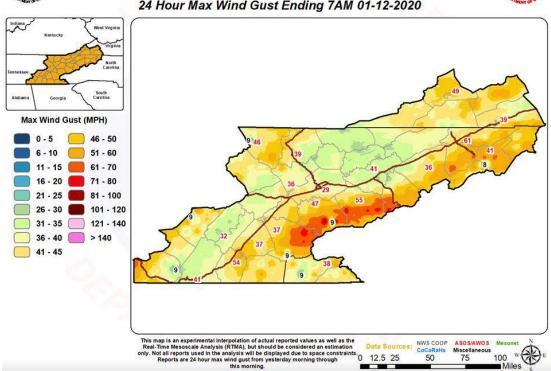

National Weather Service Morristown Tennessee

24 Hour Max Wind Gust Ending 7AM 01-12-2020

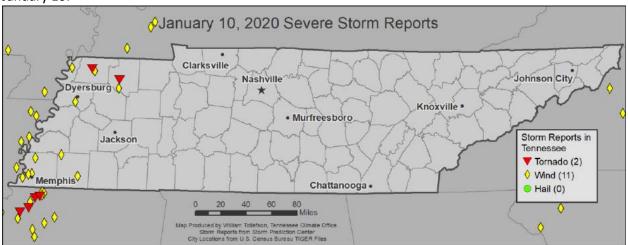

Storm Reports:

Severe storms occurred on three days during the month. Most severe weather reports were associated with the strong frontal system that moved across the state on January 10th and 11th, while there was one other isolated severe wind report on January 15th. For the month, the state reported three tornadoes, 85 severe wind occurrences, and no severe hail.

*Storm Reports are based on unfiltered Storm Prediction Center data. Future quality control checks may change the official record of severe events, please see spc.noaa.gov for any updates.

CPC Outlooks for the Next Month:

The Climate Prediction Center outlooks show all of Tennessee will likely continue to see above normal temperatures for February. Most of Tennessee will likely continue to see above normal precipitation for the month as well, however the confidence is a little lower in the western two thirds of the state.
